# RINGS WITH FINITE GORENSTEIN INJECTIVE DIMENSION

#### HENRIK HOLM

(Communicated by Bernd Ulrich)

ABSTRACT. In this paper we prove that for any associative ring R, and for any left R-module M with finite projective dimension, the Gorenstein injective dimension  $\operatorname{Gid}_R M$  equals the usual injective dimension  $\operatorname{id}_R M$ . In particular, if  $\operatorname{Gid}_R R$  is finite, then also  $\operatorname{id}_R R$  is finite, and thus R is Gorenstein (provided that R is commutative and Noetherian).

### 1. Introduction

It is well known that among the commutative local Noetherian rings  $(R, \mathfrak{m}, k)$ , the Gorenstein rings are characterized by the condition  $\mathrm{id}_R R < \infty$ . From the dual of [10, Proposition (2.27)] ([6, Proposition 10.2.3] is a special case) it follows that the Gorenstein injective dimension  $\mathrm{Gid}_R(-)$  is a refinement of the usual injective dimension  $\mathrm{id}_R(-)$  in the following sense:

For any R-module M there is an inequality  $\operatorname{Gid}_R M \leq \operatorname{id}_R M$ , and if  $\operatorname{id}_R M < \infty$ , then there is an equality  $\operatorname{Gid}_R M = \operatorname{id}_R M$ .

Now, since the injective dimension  $id_R R$  of R measures Gorensteinness, it is only natural to ask what does the Gorenstein injective dimension  $Gid_R R$  of R measure? As a consequence of Theorem (2.1) below, it turns out that:

An associative ring R with  $\operatorname{Gid}_R R < \infty$  also has  $\operatorname{id}_R R < \infty$  (and hence R is Gorenstein, provided that R is commutative and Noetherian).

This result is proved by Christensen [2, Theorem (6.3.2)] in the case where  $(R, \mathfrak{m}, k)$  is a commutative local Noetherian Cohen-Macaulay ring with a dualizing module. The aim of this paper is to prove Theorem (2.1), together with a series of related results. Among these results is Theorem (3.2), which has the nice, and easily stated, Corollary (3.3):

Assume that  $(R, \mathfrak{m}, k)$  is a commutative local Noetherian ring, and let M be an R-module of finite depth, that is,  $\operatorname{Ext}_R^m(k, M) \neq 0$  for some  $m \in \mathbb{N}_0$  (this happens for example if  $M \neq 0$  is finitely generated). If either

(i)  $\operatorname{Gfd}_R M < \infty$  and  $\operatorname{id}_R M < \infty$  or (ii)  $\operatorname{fd}_R M < \infty$  and  $\operatorname{Gid}_R M < \infty$ ,

then R is Gorenstein.

Key words and phrases. Gorenstein dimensions, homological dimensions, Gorenstein rings.

This corollary is also proved by Christensen [2, Theorem (6.3.2)] in the case where  $(R, \mathfrak{m}, k)$  is Cohen-Macaulay with a dualizing module. However, Theorem (3.2) itself (dealing not only with local rings) is a generalization of [8, Proposition 2.10] (in the module case) by Foxby from 1979.

We should briefly mention the history of Gorenstein injective, projective and flat modules: Gorenstein injective modules over an arbitrary associative ring, and the related Gorenstein injective dimension, was introduced and studied by Enochs and Jenda in [3]. The dual concept, Gorenstein projective modules, was already introduced by Auslander and Bridger [1] in 1969, but only for finitely generated modules over a two-sided Noetherian ring. Gorenstein flat modules were also introduced by Enochs and Jenda; please see [5].

**1.1. Setup and notation**. Let R be any associative ring with a nonzero multiplicative identity. All modules are—if not specified otherwise— $left\ R$ -modules. If M is any R-module, we use  $\operatorname{pd}_R M$ ,  $\operatorname{fd}_R M$ , and  $\operatorname{id}_R M$  to denote the usual projective, flat, and injective dimension of M, respectively. Furthermore, we write  $\operatorname{Gpd}_R M$ ,  $\operatorname{Gfd}_R M$ , and  $\operatorname{Gid}_R M$  for the Gorenstein projective, Gorenstein flat, and Gorenstein injective dimension of M, respectively.

### 2. Rings with finite Gorenstein injective dimension

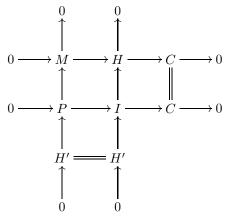

**Theorem 2.1.** If M is an R-module with  $\operatorname{pd}_R M < \infty$ , then  $\operatorname{Gid}_R M = \operatorname{id}_R M$ . In particular, if  $\operatorname{Gid}_R R < \infty$ , then also  $\operatorname{id}_R R < \infty$  (and hence R is Gorenstein, provided that R is commutative and Noetherian).

*Proof.* Since  $\mathrm{Gid}_R M \leqslant \mathrm{id}_R M$  always, it suffices to prove that  $\mathrm{id}_R M \leqslant \mathrm{Gid}_R M$ . Naturally, we may assume that  $\mathrm{Gid}_R M < \infty$ .

First consider the case where M is Gorenstein injective, that is,  $\operatorname{Gid}_R M=0$ . By definition, M is a kernel in a complete injective resolution. This means that there exists an exact sequence  $\mathbf{E}=\cdots\to E_1\to E_0\to E_{-1}\to\cdots$  of injective R-modules, such that  $\operatorname{Hom}_R(I,\mathbf{E})$  is exact for every injective R-module I, and such that  $M\cong\operatorname{Ker}(E_1\to E_0)$ . In particular, there exists a short exact sequence  $0\to M'\to E\to M\to 0$ , where E is injective, and M' is Gorenstein injective. Since M' is Gorenstein injective and  $\operatorname{pd}_R M<\infty$ , it follows by [4, Lemma 1.3] that  $\operatorname{Ext}^1_R(M,M')=0$ . Thus  $0\to M'\to E\to M\to 0$  is split-exact; so M is a direct summand of the injective module E. Therefore, M itself is injective.

Next consider the case where  $\operatorname{Gid}_R M > 0$ . By [10, Theorem (2.15)] there exists an exact sequence  $0 \to M \to H \to C \to 0$  where H is Gorenstein injective and  $\operatorname{id}_R C = \operatorname{Gid}_R M - 1$ . As in the previous case, since H is Gorenstein injective, there exists a short exact sequence  $0 \to H' \to I \to H \to 0$  where I is injective and H' is Gorenstein injective. Now consider the pull-back diagram with exact rows and

columns:

Since I is injective and  $\mathrm{id}_R C = \mathrm{Gid}_R M - 1$  we get  $\mathrm{id}_R P \leqslant \mathrm{Gid}_R M$  by the second row. Since H' is Gorenstein injective and  $\mathrm{pd}_R M < \infty$ , it follows (as before) by [4, Lemma 1.3] that  $\mathrm{Ext}^1_R(M,H') = 0$ . Consequently, the first column  $0 \to H' \to P \to M \to 0$  splits. Therefore  $P \cong M \oplus H'$ , and hence  $\mathrm{id}_R M \leqslant \mathrm{id}_R P \leqslant \mathrm{Gid}_R M$ .

The theorem above has, of course, a dual counterpart:

**Theorem 2.2.** If M is an R-module with  $id_R M < \infty$ , then  $Gpd_R M = pd_R M$ .  $\square$ 

Theorem (2.6) below is a "flat version" of the two previous theorems. First recall the following.

**Definition 2.3.** The *left finitistic projective dimension* LeftFPD(R) of R is defined as

LeftFPD(R) = sup{ 
$$\operatorname{pd}_R M \mid M \text{ is a } \operatorname{left} R\text{-module with } \operatorname{pd}_R M < \infty$$
 }.

The right finitistic projective dimension RightFPD(R) of R is defined similarly.

Remark 2.4. When R is commutative and Noetherian, we have that LeftFPD(R) and RightFPD(R) equals the Krull dimension of R, by [9, Théorème (3.2.6) (Seconde partie)].

Furthermore, we will need the following result from [10, Proposition (3.11)]:

**Proposition 2.5.** For any (left) R-module M the inequality

$$\operatorname{Gid}_{R}\operatorname{Hom}_{\mathbb{Z}}(M,\mathbb{Q}/\mathbb{Z}) \leqslant \operatorname{Gfd}_{R}M$$

holds. If R is right coherent, then we have  $Gid_RHom_{\mathbb{Z}}(M,\mathbb{Q}/\mathbb{Z})=Gfd_RM$ .

We are now ready to state:

**Theorem 2.6.** For any R-module M, the following conclusions hold:

- (i) Assume that LeftFPD(R) is finite. If  $fd_RM < \infty$ , then  $Gid_RM = id_RM$ .
- (ii) Assume that R is left and right coherent with finite RightFPD(R). If  $id_R M < \infty$ , then  $Gfd_R M = fd_R M$ .

*Proof.* (i) If  $\mathrm{fd}_R M < \infty$ , then also  $\mathrm{pd}_R M < \infty$ , by [11, Proposition 6] (since LeftFPD $(R) < \infty$ ). Hence the desired conclusion follows from Theorem (2.1) above.

(ii) Since R is left coherent, we have that  $\mathrm{fd}_R\mathrm{Hom}_{\mathbb{Z}}(M,\mathbb{Q}/\mathbb{Z}) \leqslant \mathrm{id}_R M < \infty$ , by [12, Lemma 3.1.4]. By assumption, RightFPD(R) <  $\infty$ , and therefore also

 $\operatorname{pd}_R\operatorname{Hom}_{\mathbb{Z}}(M,\mathbb{Q}/\mathbb{Z})<\infty$ , by [11, Proposition 6]. Now Theorem (2.1) gives that  $\operatorname{Gid}_R\operatorname{Hom}_{\mathbb{Z}}(M,\mathbb{Q}/\mathbb{Z})=\operatorname{id}_R\operatorname{Hom}_{\mathbb{Z}}(M,\mathbb{Q}/\mathbb{Z})$ . It is well known that

$$fd_R M = id_R Hom_{\mathbb{Z}}(M, \mathbb{Q}/\mathbb{Z})$$

(without assumptions on R), and by Proposition (2.5) above, we also get  $Gfd_RM = Gid_RHom_{\mathbb{Z}}(M,\mathbb{Q}/\mathbb{Z})$ , since R is right coherent. The proof is done.

## 3. A THEOREM ON GORENSTEIN RINGS BY FOXBY

We end this paper by generalizing a theorem [8, Proposition 2.10] on Gorenstein rings by Foxby from 1979. For completeness, we briefly recall:

**3.1. The small support.** Assume that R is commutative and Noetherian. For an R-module M, an integer n, and a prime ideal  $\mathfrak p$  in R, we write  $\beta_n^R(\mathfrak p, M)$ , respectively,  $\mu_R^n(\mathfrak p, M)$ , for the nth Betti number, respectively, nth Bass number, of M at  $\mathfrak p$ .

Foxby [8, Definition p. 157] or [7, (14.8)] defines the *small (or homological)* support of an R-module M to be the set

$$\operatorname{supp}_R M = \{ \mathfrak{p} \in \operatorname{Spec} R \mid \exists n \in \mathbb{N}_0 \colon \beta_n^R(\mathfrak{p}, M) \neq 0 \}.$$

Let us mention the most basic results about the small support, all of which can be found in [8, pp. 157 - 159] and [7, Chapter 14]:

- (a) The small support,  $\operatorname{supp}_R M$ , is contained in the usual (large) support,  $\operatorname{Supp}_R M$ , and  $\operatorname{supp}_R M = \operatorname{Supp}_R M$  if M is finitely generated. Also, if  $M \neq 0$ , then  $\operatorname{supp}_R M \neq \emptyset$ .
- (b)  $\operatorname{supp}_R M = \{ \mathfrak{p} \in \operatorname{Spec} R \mid \exists n \in \mathbb{N}_0 \colon \mu_R^n(\mathfrak{p}, M) \neq 0 \}.$
- (c) Assume that  $(R, \mathfrak{m}, k)$  is local. If M is an R-module with finite depth, that is,

$$\operatorname{depth}_R M := \inf \{ \ m \in \mathbb{N}_0 \mid \operatorname{Ext}_R^m(k, M) \neq 0 \ \} < \infty$$

(this happens for example if  $M \neq 0$  is finitely generated), then  $\mathfrak{m} \in \operatorname{supp}_R M$ , by (b) above.

Now, given these facts about the small support, and the results in the previous section, the following generalization of [8, Proposition 2.10] is immediate:

**Theorem 3.2.** Assume that R is commutative and Noetherian. Let M be any R-module, and assume that any of the following four conditions is satisfied:

- (i)  $\operatorname{Gpd}_R M < \infty$  and  $\operatorname{id}_R M < \infty$ ,
- (ii)  $\operatorname{pd}_R M < \infty$  and  $\operatorname{Gid}_R M < \infty$ ,
- (iii) R has finite Krull dimension, and  $Gfd_RM < \infty$  and  $id_RM < \infty$ ,
- (iv) R has finite Krull dimension, and  $fd_R M < \infty$  and  $Gid_R M < \infty$ .

Then  $R_{\mathfrak{p}}$  is a Gorenstein local ring for all  $\mathfrak{p} \in \operatorname{supp}_R M$ .

**Corollary 3.3.** Assume that  $(R, \mathfrak{m}, k)$  is a commutative local Noetherian ring. If there exists an R-module M of finite depth, that is,

$$\operatorname{depth}_{R}M := \inf\{ m \in \mathbb{N}_{0} \mid \operatorname{Ext}_{R}^{m}(k, M) \neq 0 \} < \infty,$$

and which satisfies either

- (i)  $Gfd_R M < \infty$  and  $id_R M < \infty$ , or
- (ii)  $\operatorname{fd}_R M < \infty$  and  $\operatorname{Gid}_R M < \infty$ ,

then R is Gorenstein.

#### ACKNOWLEDGMENTS

I would like to express my gratitude to my Ph.D. advisor Hans-Bjørn Foxby for his support, and our helpful discussions.
